Appln. No. 09/888,247 Reply dated Jan. 20, 2006 to Interview Summary dated Dec. 20, 2005 Docket No. 6169-190

## Amendments to the Claims;

This listing of claims will replace all prior versions and listings of claims in the instant application:

## Listing of Claims:

- 1. (Currently Amended) A monitoring tool comprising:
- a placebo transaction dispatcher for dispatching placebo transactions to at least one subscribing e-commerce system;
  - a response collector for collecting responses to dispatched placebo transactions;
- a logger for computing transaction latency data based upon when a placebo transaction is dispatched to said at least one subscribing e-commerce system, and when a response is received in said collector;
- a <u>multi-dimensional</u> status array indexed by a URL and sample size of each at least one subscribing e-commerce system, said <u>multi-dimensional</u> status array comprising an indicator indicating that a placebo transaction has been submitted to a corresponding subscribing e-commerce system, an indicator indicating whether a response has been received from the corresponding subscribing e-commerce system, transaction latency data associated with the corresponding subscribing e-commerce system, and an average response time for the corresponding subscribing e-commerce system; and,

an alerter for alerting said subscribing e-commerce system when computed transaction latency data indicates an unreliable response condition in an associated back-end transaction processing system.

2. (Original) The monitoring tool of claim 1, further comprising a user interface through which a user can monitor said transaction latency data.

Appln. No. 09/888,247 Reply dated Jan. 20, 2006 to Interview Summary dated Dec. 20, 2005 Docket No. 6169-190

3. (Original) The monitoring tool of claim 1, further comprising a list of references to a plurality of subscribing e-commerce systems, said dispatcher dispatching placebo transactions to each e-commerce system in said list, said collector collecting responses to said dispatched placebo transactions, said logger computing transaction latency data based upon when each placebo transaction is dispatched to a subscribing e-commerce system, and when a corresponding response is received in said collector, said alerter alerting individual subscribing e-commerce systems when computed transaction latency data for said individual subscribing e-commerce systems indicates an unreliable response condition in an associated back-end transaction processing system.

## 4. (Currently Amended) A monitoring tool comprising:

a placebo transaction dispatcher for dispatching placebo transactions to at least one back-end transaction processing system associated with a subscribing e-commerce system;

a response collector for collecting responses to dispatched placebo transactions;

a logger for computing transaction latency data based upon when a placebo transaction is dispatched to said back-end transaction processing system, and when a response is received in said collector;

a <u>multi-dimensional</u> status array indexed by a URL and sample size of each at least one subscribing e-commerce system, said <u>multi-dimensional</u> status array comprising an indicator indicating that a placebo transaction has been submitted to a corresponding subscribing e-commerce system, an indicator indicating whether a response has been received from the corresponding subscribing e-commerce system, transaction latency data associated with the corresponding subscribing e-commerce system, and an average response time for the corresponding subscribing e-commerce system; and,

Appln. No. 09/888,247 Reply dated Jan. 20, 2006 to Interview Summary dated Dec. 20, 2005 Docket No. 6169-190

an alerter for alerting said subscribing e-commerce system when computed transaction latency data indicates an unreliable response condition in said at least one associated back-end transaction processing system.

- 5. (Original) The monitoring tool of claim 4, further comprising a user interface through which a user can monitor said transaction latency data.
- 6. (Currently Amended) A computer-implemented method for detecting an unreliable response condition in at least one back-end transaction processing system associated with an e-commerce system comprising the steps of:

generating a placebo transaction;

dispatching said placebo transaction to the e-commerce system;

determining if a response to said placebo transaction is received;

if no response to said placebo transaction is received prior to detecting a time-out condition, notifying the e-commerce system that an unreliable response condition exists in the at least one back-end transaction processing system;

if a response to said placebo transaction is received after period of time has elapsed from said dispatching of said placebo transaction which exceeds a latency threshold, notifying e-commerce system that an unreliable response condition exists in the at least one back-end transaction processing system; and

recording a plurality of elements in a <u>multi-dimensional</u> status array indexed by a URL and a sample size for each at least one back-end transaction processing system, said <u>multi-dimensional</u> status array comprising an indicator indicating that a placebo transaction has been submitted to a corresponding subscribing e-commerce system, an indicator indicating whether a response has been received from the corresponding subscribing e-commerce system, an indicator indicating whether a latency threshold has

Appln. No. 09/888,247 Reply dated Jan. 20, 2006 to Interview Summary dated Dec. 20, 2005 Docket No. 6169-190

been exceeded by the corresponding subscribing e-commerce system, and an average response time for the corresponding subscribing e-commerce system.

7. (Currently Amended) A computer-implemented method for detecting an unreliable response condition in at least one back-end transaction processing system associated with an e-commerce system comprising the steps of:

generating a placebo transaction;

dispatching said placebo transaction to the back-end transaction processing system;

determining if a response to said placebo transaction is received;

if no response to said placebo transaction is received prior to detecting a time-out condition, notifying the e-commerce system that an unreliable response condition exists in the back-end transaction processing system;

if a response to said placebo transaction is received after period of time has elapsed from said dispatching of said placebo transaction which exceeds a latency threshold, notifying the e-commerce system that an unreliable response condition exists in the back-end transaction processing system; and

recording a plurality of elements in a <u>multi-dimensional</u> status array indexed by a URL and a sample size for each at least one back-end transaction processing system, said <u>multi-dimensional</u> status array comprising an indicator indicating that a placebo transaction has been submitted to a corresponding subscribing e-commerce system, an indicator indicating whether a response has been received from the corresponding subscribing e-commerce system, an indicator indicating whether a latency threshold has been exceeded by the corresponding subscribing e-commerce system, and an average response time for the corresponding subscribing e-commerce system.

Appln. No. 09/888,247 Reply dated Jan. 20, 2006 to Interview Summary dated Dec. 20, 2005 Docket No. 6169-190

8. (Currently Amended) A computer-implemented method for detecting unreliable response conditions in a plurality of back-end transaction processing systems comprising the steps of:

reading a list of references to a plurality of subscribing e-commerce systems;
generating and dispatching placebo transactions to each e-commerce system in said list:

receiving responses to said dispatched placebo transactions;

computing transaction latency data based upon when each placebo transaction is dispatched to a subscribing e-commerce system, and when a corresponding response is received;

recording a plurality of elements in a <u>multi-dimensional</u> status array indexed by a URL and a sample size for each e-commerce system, said <u>multi-dimensional</u> status array comprising an indicator indicating that a placebo transaction has been submitted to a corresponding subscribing e-commerce system, an indicator indicating whether a response has been received from the corresponding subscribing e-commerce system, transaction latency data associated with the corresponding subscribing e-commerce system, and an average response time for the corresponding subscribing e-commerce system; and

notifying individual subscribing e-commerce systems when computed transaction latency data for said individual subscribing e-commerce systems indicates an unreliable response condition in an associated back-end transaction processing system.

9. (Currently Amended) A machine readable storage having stored thereon a computer program for detecting an unreliable response condition in a back-end transaction processing system associated with an e-commerce system, said computer program having a plurality of code sections executable by a machine for causing the machine to perform the steps of:

Appln. No. 09/888,247 Reply dated Jan. 20, 2006 to Interview Summary dated Dec. 20, 2005 Docket No. 6169-190

generating a placebo transaction;

dispatching said placebo transaction to the back-end transaction processing system;

determining if a response to said placebo transaction is received;

if no response to said placebo transaction is received prior to detecting a time-out condition, notifying the e-commerce system that an unreliable response condition exists in the back-end transaction processing system;

if a response to said placebo transaction is received after period of time has elapsed from said dispatching of said placebo transaction which exceeds a latency threshold, notifying the e-commerce system that an unreliable response condition exists in the back-end transaction processing system; and

recording a plurality of elements in a <u>multi-dimensional</u> status array indexed by a URL and a sample size for said transaction processing system, said <u>multi-dimensional</u> status array comprising an indicator indicating that a placebo transaction has been submitted to a corresponding subscribing e-commerce system, an indicator indicating whether a response has been received from the corresponding subscribing e-commerce system, an indicator indicating whether a latency threshold has been exceeded by the corresponding subscribing e-commerce system, and an average response time for the corresponding subscribing e-commerce system.

10. (Currently Amended) A machine readable storage having stored thereon a computer program for detecting an unreliable response condition in a back-end transaction processing system associated with an e-commerce system, said computer program having a plurality of code sections executable by a machine for causing the machine to perform the steps of:

generating a placebo transaction;

Appln. No. 09/888,247 Reply dated Jan. 20, 2006 to Interview Summary dated Dec. 20, 2005 Docket No. 6169-190

dispatching said placebo transaction to the back-end transaction processing system;

determining if a response to said placebo transaction is received;

if no response to said placebo transaction is received prior to detecting a time-out condition, notifying the e-commerce system that an unreliable response condition exists in the back-end transaction processing system;

if a response to said placebo transaction is received after period of time has elapsed from said dispatching of said placebo transaction which exceeds a latency threshold, notifying the e-commerce system that an unreliable response condition exists in the back-end transaction processing system; and

recording a plurality of elements in a <u>multi-dimensional</u> status array indexed by a URL and a sample size for said back-end transaction processing system, said <u>multi-dimensional</u> status array comprising an indicator indicating that a placebo transaction has been submitted to a corresponding subscribing e-commerce system, an indicator indicating whether a response has been received from the corresponding subscribing e-commerce system, an indicator indicating whether a latency threshold has been exceeded by the corresponding subscribing e-commerce system, and an average response time for the corresponding subscribing e-commerce system.

## 11. (Cancelled)
